

A Modern Approach to Fire Alarm Management

Nimbus

Fire safety

Every facility or property manager recognises their core responsibility to keep people and property safe. Ensuring compliance with fire safety standards and other regulations means that fire equipment is working correctly and evacuation procedures are clear. Likewise, testing and maintaining fire alarm management systems against these standards is the cornerstone of building fire safety.

However, managing fire alarm systems across several buildings or a property portfolio is not straightforward. No two buildings are the same, including fire alarm systems, and the complexity increases when multiple service providers perform testing and maintenance.

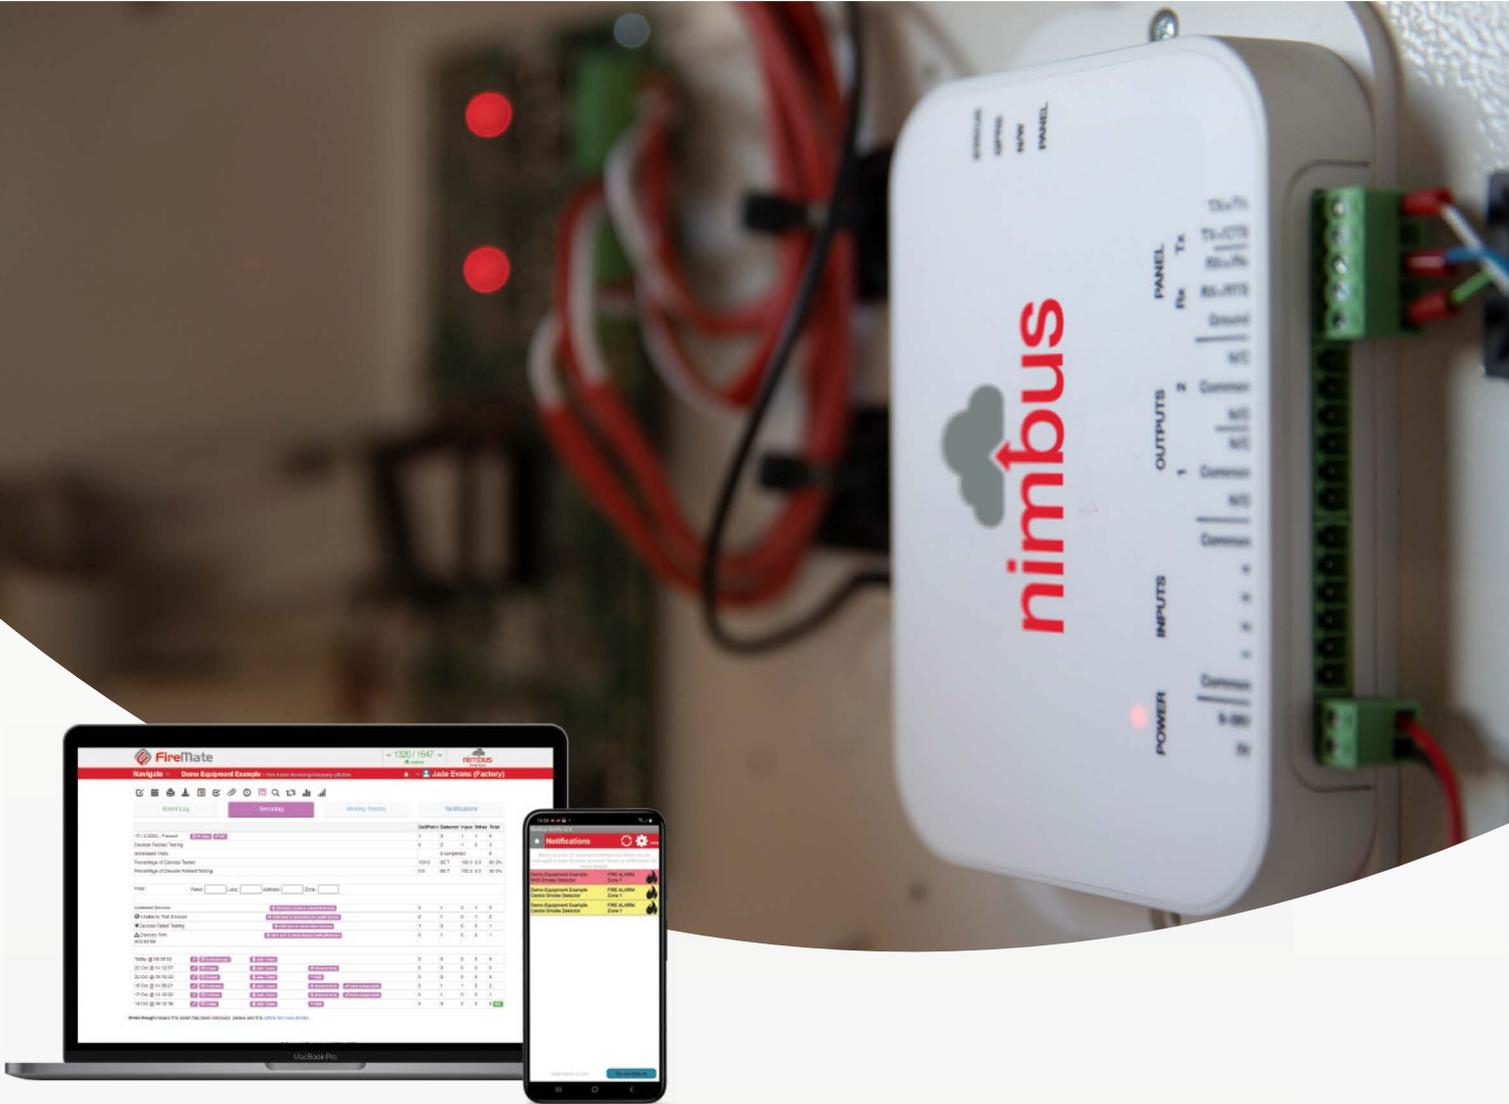

A single view

Nimbus from FireMate offers property managers and fire maintenance professionals a single view of these life-saving systems. The solution provides the ability to fully control and monitor every alarm in your property portfolio and see all information relating to each alarm in real-time via a desktop or mobile internet connection.

Scalable and reliable

Nimbus is delivered using modern cloud-based infrastructure, which means the system is highly reliable and suitable for a single building or an extensive property portfolio. The system offers visibility of your entire fire alarm portfolio anywhere, anytime, regardless of fire alarm type or manufacturer.

Be in the know

Instant event notifications

Receive confirmed fire, fault, isolation, and other notifications by email, via the Nimbus Notify App or the Nimbus web portal. Get the complete picture of your fire assets by quickly drilling down into device location, status and further details.

Automatic capture of testing

Nimbus provides unequivocal proof that service testing has been undertaken to appropriate standards through the automatic, non-editable digital collection of test data. This data also provides the basis for management reports and audits.

Simple installation

The Nimbus Fixed Gateway is a non-intrusive add-on to existing fire alarm control panels that is simple to install. It is compatible with most addressable and conventional fire alarm control panels and presents the system status data in a simple-to-use format.

Ensure weekly testing compliance

The Nimbus Weekly Test app notifies Facilities Managers of a pending 'fire alarm weekly test' with specific instructions on which Manual Call Points (MCPs) should be tested.
